In preparation for **Honors Algebra 2**, we have prepared a packet of concepts that students should know how to do. These concepts have been taught in previous math classes. This packet does not require you to use a calculator; in fact you should not use a calculator on some of the problem sets where it is noted. **Honors Algebra 2** builds on the concepts in this packet. We start teaching Algebra 2 concepts on the first day of school. We expect you to know the concepts in the packet in order to help you be successful in **Honors Algebra 2**.

If you are struggling with this packet, get help from a friend, parent, or tutor. If you can’t find someone to help you, there are tutors available. A list of tutors can be found by calling Reagan High School. Keep in mind these tutors may charge a fee.

You will have a graded assignment within the first two weeks of school. The graded assignment will cover all the concepts in the packet, but will not be the exact same problems. The graded assignment will contain a calculator inactive part.

ANSWER

KEYS
1. Proportions vs. multiplying fractions
   (cross multiplying for a proportion vs. multiplying numerators and multiplying denominators when multiplying fractions)
   \[
   \frac{2}{x} = \frac{8}{12} \quad \text{vs.} \quad \frac{2}{3} \cdot \frac{8}{12} \\
   \frac{24 = 8x}{3 \cdot 12} = \frac{16}{36} = \frac{4}{9} \\
   3 = x
   \]

2. \( x \cdot x = x^2 \) vs. \( x + x = 2x \)

3. order of operations: don’t be tricked by these common “mistaken identities”
   a. \( 5 \cdot 2^3 \) vs. \( (5 \cdot 2)^3 \)
   \[
   5 \cdot 8 = 40 \quad 10^3 = 1000 \\
   \]
   b. \( 5 + 3(x + 4) \)
   c. \( -8^2 \) vs. \( (-8)^2 \)
   \[
   5 + 3x + 12 \quad \text{not} \quad 8(x + 4) \quad -1 \cdot 64 = 64 \quad (-8)(-8) = 64 \\
   \]

4. \((x - 9)^2\) vs. \((x + 9)^2\) vs. \((x - 9)(x + 9)\)
   a. \( (x - 9)^2 = x^2 - 9x - 9x + 81 = x^2 - 18x + 81 \)
   b. \( (x + 9)^2 = x^2 + 9x + 9x + 81 = x^2 + 18x + 81 \)
   c. \( (x - 9)(x + 9) = x^2 + 9x - 9x - 81 = x^2 - 81 \)

5. know the difference between a term, expression, equation, and inequality
   term – number, variable, or product of numbers and variables (ex: 2, x, or 2x)

   inequality – expressions not equal to one another (ex: \( x > 2 \), \( 4x + 3 \leq 12 - 5x \))

   evaluate – to find the value of (once the value has been found, the final result should be written in simplest form)

7. know the difference between rational and irrational
   rational – real number that can be written as a fraction (ex: 0, 1, \( \frac{1}{3} \), \( \sqrt{121} \), 0.25) [repeating or terminating decimals]
   irrational – real number that can’t be written as a fraction [nonrepeating, nonterminating decimals] (ex: \( \sqrt{12} \), \( \pi \), 2.478192...)

8. know the symbols by name:
   \( > \) as “greater than” vs. \( < \) as “less than”
9. know coefficient – \textit{numerical factor of a monomial [number being multiplied by a variable]}

10. know factor – \textit{two or more numbers that multiply to produce another number [2 and 5 are factors of 10]}

11. reduce entire factors \textbf{not} parts of a factor (individual terms)

- \textbf{you can reduce} \( \frac{10x - 5}{2x - 1} \) by rewriting the numerator in factored form first: \( \frac{10x - 5}{2x - 1} = \)

\[
\frac{5(2x - 1)}{2x - 1} = 5
\]

- \textbf{you can’t reduce} \( \frac{10x - 5}{2x - 1} \) by trying to reduce just \( \frac{10x - 5}{2x - 1} \)
Fractions

1) \( \frac{2}{3} + \frac{4}{9} = \frac{10}{9} \)

4) \( \frac{2}{3} \cdot \frac{4}{9} = \frac{8}{27} \)

5) \( \frac{7}{4} \cdot \frac{4}{5} = \frac{7}{5} \)

6) \( \frac{3}{4} \cdot \frac{1}{6} = \frac{1}{8} \)

7) \( \frac{2}{3} \div \frac{4}{9} = \frac{3}{2} \)

Rational Exponents

See these as examples of rational exponents:

- $25^{\frac{1}{2}} = \sqrt{25}$
- $125^{\frac{1}{3}} = \sqrt[3]{125}$
- $81^{\frac{1}{4}} = \sqrt[4]{81}$

Simplify the following.

- $16^{\frac{1}{2}} = 4$
- $27^{\frac{1}{3}} = 3$
- $256^{\frac{1}{4}} = 4$
- $-36^{\frac{1}{2}} = -6$

Write as a rational exponent:

- $\sqrt{121} = 121^{\frac{1}{2}}$
- $\sqrt[3]{64} = 64^{\frac{1}{3}}$
- $\sqrt[4]{16} = 16^{\frac{1}{4}}$
